Shopify FedEx Shipping App

RELEASE NOTES

Release v2.3.119

Support Guide · Story Card Package

May 07, 2026

INCLUDED STORY CARDS

FDX-108
#383123
Chile domestic FedEx services not mapped in app

FDX-008
#361816
SLGP account selection follows ship-to country

FDX-007
Commercial invoice letterhead/signature missing for secondary account

From SL: FDX-108 — Chile domestic FedEx services not mapped in app [#383123]

Feature Reference: FDX-108

Trello: <https://trello.com/c/9RyBQrjC/4284-from-sl-fdx-108-chile-domestic-fedex-services-not-mapped-in-app-383123>

App Release: v2.3.119

Approved: Unknown

Developed by: Unknown

Tested by: QA Team

Feature Summary

This change restores the correct FedEx domestic service mapping for Chile-based merchants. Before this fix, Chile domestic shipments could miss valid FedEx domestic services in the app, or the store could fall back to incorrect region defaults instead of using Chile-specific service mappings.

With this release, Chile domestic rate requests are expected to return the correct service list for Chile, including FEDEX_ECONOMY_FREIGHT where applicable. Support should also see the service displayed with the expected app label rather than a blank or undefined value in rate-related views.

Toggles & Prerequisites

- No feature toggle is required.
- This is relevant for Chile (CL) merchants using FedEx domestic services.
- The migration 20260430060000-add_fedex_economy_freight_service.js must be applied for shops that need the Chile service backfill.
- The store must already have a valid Chile FedEx account and a Chile domestic order available for testing.

Where to Find This in the App

- Shopify checkout or order-rate flow for Chile domestic shipments
- FedEx app rate-related views for returned services
- Rates Log / rate history view where service names are shown

Step-by-Step Walkthrough (Support / Demo)

Scenario A - Chile domestic order returns the expected service

1. Open a Chile-based store that has the PluginHive FedEx app configured.
2. Use or create a test order with a Chile domestic destination.
3. Trigger a shipping rate request.
4. Confirm the service list includes the expected Chile domestic options.
5. Confirm FEDEX_ECONOMY_FREIGHT appears where applicable and is shown with the expected service label.

Scenario B - Rate log shows the service cleanly

1. Open the FedEx app and go to the rate history or Rates Log view.
2. Search for a recent Chile domestic request that returned FEDEX_ECONOMY_FREIGHT.
3. Confirm the entry displays a readable service name such as FedEx Economy Freight.
4. Confirm support does not see blank labels or undefined values for that service.

Scenario C - Label generation still works with the mapped Chile service

1. Open an order that already has the Chile domestic service assigned.
2. Generate the label as usual.
3. Confirm the label is created successfully and the shipment continues normally after service selection.

Expected Behaviour - What Support Should Observe

- Chile domestic shipments return Chile-appropriate services instead of falling back to the wrong region behavior.
- FEDEX_ECONOMY_FREIGHT is available when expected.
- The service name is displayed properly in the UI and rates log.
- Label generation continues successfully for orders using the mapped service.

Business-Safe Explanation (For Merchant-Facing Communication)

> We corrected the service mapping for Chile domestic shipments so the app now returns the right FedEx options for Chile-based orders. Merchants should see the expected domestic services again without needing to change their day-to-day workflow.

Common Questions & Troubleshooting

Q: A Chile merchant still does not see the expected domestic service. What should support check first?

Confirm the store is truly shipping within Chile, the merchant's FedEx account is active for that market, and the migration for Chile services has been applied.

Q: The service appears in the response, but the name looks blank or wrong in the UI. What should support check?

Confirm the issue is in the display layer rather than the returned service list. The intended outcome for this release is that FEDEX_ECONOMY_FREIGHT shows with a readable label in the app.

Q: Does this change affect US, Canada, EU, or other regions?

This release is intended to backfill Chile-specific service handling without changing other regional service lists.

Known Limitations / Rollout Notes

- This guide is based on the approved card and stored test cases; developer ownership was not present in the local release data.
- This change is only meaningful for Chile merchants and Chile domestic shipment scenarios.
- If a store has not received the required migration, support may still observe pre-fix behavior.

App Release: v2.3.119

Approved: Unknown

Developed by: Unknown

Tested by: QA Team

Feature Summary

This change improves how the Shipping Label Generation Page (SLGP) chooses the FedEx account that is pre-selected for an order. Instead of using a less reliable default, the app now follows the ship-to country when account conditions are configured.

For support teams, this means the initial account shown on the label page should usually match the destination-country rules the merchant configured in **Settings > Accounts**. Merchants can still manually change the account before label generation when needed.

Toggles & Prerequisites

- No feature toggle is required.
- Multiple FedEx accounts must be configured for the store to see the main benefit.
- Country-based account conditions must be set in **Settings > Accounts** if the merchant wants different accounts for different destinations.
- If only one account exists, the single account should continue to behave as before.

Where to Find This in the App

- Orders list
- Order Details / SLGP
- FedEx Account Selector dropdown on the label-generation flow

Step-by-Step Walkthrough (Support / Demo)

Scenario A - UK order pre-selects the secondary account

1. Open a store with more than one FedEx account configured.
2. Confirm country conditions are set so UK orders should use the secondary account.
3. Open an order where the ship-to country is UK.
4. On SLGP, inspect the FedEx Account Selector.
5. Confirm the secondary account is already selected before label generation.

Scenario B - Merchant overrides the suggested account

1. Stay on the same order after the correct account is pre-selected.
2. Open the FedEx Account Selector dropdown.
3. Change the selection from the suggested account to another available account.
4. Generate the label.
5. Confirm the label uses the manually selected account, not the original pre-selected value.

Scenario C - Unmapped country falls back cleanly

1. Open an order whose ship-to country does not have a country rule.
2. Inspect the FedEx Account Selector.
3. Confirm the app falls back to the primary/default account.
4. Confirm the order can still proceed without an account-selection error.

Expected Behaviour - What Support Should Observe

- The pre-selected account should match the ship-to country rule when one exists.
- Manual override should still work.
- Unmapped, invalid, or unsupported country conditions should fall back gracefully to the primary account.
- Account selection should resolve independently for each order rather than carrying over from a previous order.

Business-Safe Explanation (For Merchant-Facing Communication)

> We improved account selection during label generation so the app now chooses the most appropriate FedEx account based on the destination country when country rules are configured. Merchants can still change the account manually before generating a label if they need to make a one-off adjustment.

Common Questions & Troubleshooting

Q: The wrong account is pre-selected for an order. What should support check first?

Check the store's account-condition setup in Settings > Accounts and verify the ship-to country on the order matches the merchant's intended rule.

Q: What happens if the merchant has not configured any country-based account rules?

The expected fallback is the primary account.

Q: Does this remove the merchant's ability to manually choose another account?

No. The change affects the default selection only; the merchant should still be able to override it before generating the label.

Known Limitations / Rollout Notes

- This guide assumes the merchant has valid multi-account setup and country conditions configured.
- Single-account stores should not see a meaningful workflow change beyond normal label generation.
- Local release data did not include named developer/tester ownership, so ownership fields are marked as unknown / QA Team.

From SL: FDX-007 — Commercial invoice letterhead/signature missing for secondary account

Feature Reference: FDX-007

Trello: <https://trello.com/c/fxhDuYXW/4286-from-sl-fdx-007-commercial-invoice-letterhead-signature-missing-for-secondary-account>

App Release: v2.3.119

Approved: Unknown

Developed by: Unknown

Tested by: QA Team

Feature Summary

This release fixes a branding gap on commercial invoices generated with a secondary FedEx account. Before this change, merchants using a secondary account could end up with a commercial invoice that did not show the expected letterhead or signature for that selected account.

With the fix in place, commercial invoices generated with a secondary account should use that account's own branding assets when those assets are configured. The release also preserves graceful behavior when a secondary account does not yet have one or both assets uploaded.

Toggles & Prerequisites

- No feature toggle is required.
- This applies to international shipments that produce a commercial invoice.
- The store must have more than one FedEx account configured to validate the secondary-account behavior.
- To see the full effect, the relevant letterhead and signature files must be uploaded for the secondary account.

Where to Find This in the App

- Settings > Accounts for per-account setup and persistence checks
- International shipping label workflow
- Commercial Invoice PDF downloaded after label generation

Step-by-Step Walkthrough (Support / Demo)

Scenario A - Secondary account commercial invoice shows the correct branding

1. Confirm the store has both primary and secondary FedEx accounts configured.
2. Confirm the secondary account has its own letterhead and signature files uploaded.
3. Open an international order that requires a commercial invoice.
4. Generate the label and explicitly select the secondary account.
5. Download the commercial invoice PDF.
6. Confirm the invoice shows the secondary account's branding, not the primary account's branding.

Scenario B - Primary account remains unchanged

1. Generate a commercial invoice using the secondary account and verify its branding.
2. Then generate another international label using the primary account.
3. Download the second commercial invoice PDF.

4. Confirm the primary account's commercial invoice still shows the primary account's own branding.
5. Confirm there is no cross-account branding mix-up.

Scenario C - Missing assets degrade gracefully

1. Use a secondary account that does not have one or both branding assets uploaded.
2. Generate an international label that produces a commercial invoice.
3. Download the invoice PDF.
4. Confirm the invoice still generates successfully.
5. Confirm the missing asset is simply absent rather than breaking the invoice layout or blocking the workflow.

Expected Behaviour - What Support Should Observe

- Commercial invoices generated with the secondary account show the secondary account's configured letterhead and signature.
- Primary-account invoices continue to show primary-account branding.
- If a secondary account is missing one or both assets, invoice generation still succeeds and the layout remains usable.
- Upload persistence and validation should behave normally when account-level upload controls are available.

Business-Safe Explanation (For Merchant-Facing Communication)

> We fixed commercial invoice branding for stores that use more than one FedEx account. When a merchant generates an international shipment with a secondary account, the invoice should now reflect that selected account's branding more reliably, while still generating cleanly if optional branding files are missing.

Common Questions & Troubleshooting

Q: The merchant selected a secondary account, but the invoice branding still looks wrong. What should support check first?

Verify which account was selected during label generation, then confirm the secondary account actually has its own letterhead and signature files configured.

Q: Will invoice generation fail if the secondary account does not have a signature or letterhead uploaded?

The expected behavior is graceful degradation: the invoice should still generate, but the missing branding element will not appear.

Q: Can this affect domestic labels?

This guide is focused on international shipments that generate a commercial invoice.

Known Limitations / Rollout Notes

- The stored release data references per-account upload behavior for secondary-account assets; support should validate the store's account configuration before escalating invoice-branding issues.
- This guide is scoped to commercial invoice output and related account branding behavior, not to unrelated label-layout issues.
- Local release data did not include named developer/tester ownership, so ownership fields are marked as unknown / QA Team.
